Comprehensive Care for

Chronic Obstructive Pulmonary Disease

COPD

When you are diagnosed with COPD, which includes Chronic Bronchitis and Emphysema, you will likely have many questions and the answers may not always be clear at first. Not all people with COPD have the same symptoms and treatment may differ from person to person.

Most people have mild forms of COPD for which little therapy is needed other than smoking cessation. Even for more advanced disease stages effective therapy is available that can control symptoms, reduce your risk of complications and breathing attacks and improve your ability to lead an active life.

Throughout your hospital stay specialized Respiratory Therapy Navigators will visit you and help you understand your disease and treatment options. Navigators will assist you in making choices regarding your discharge plan and follow up care.

They will explain your treatment plan and what tests are needed to properly diagnose your disease. Each patient's needs are different and our Navigators are specially trained to help you work through the complicated process of COPD care management.

Navigators will help put your mind at ease to answer questions and explain issues related to your COPD treatment and disease. They will assist you in understanding all the various breathing medications as well as what things you can do to improve your quality of life.

To maximize your care after a breathing attack, our patients will now have the option of visiting our **COPD Clinic** to fine tune your discharge plan and take control of your symptoms. In the clinic you will be seen by a trained Physician along side a Specialized Respiratory Therapist to assure you have the best plan and help you assess your future COPD needs. The clinic is designed to see patients weekly up to 4 weeks after discharge to bridge the Gap between going home and your next visit to your Primary Care or Lung doctor.
